

Slim High-force Gripper **RCP6-GRT7**

Equipped with a Battery-less Absolute Encoder

First Time Ever! New Gripper Equipped with Battery-less Absolute Encoder. Flat and Slim Shape with Height of 39 mm Achieved.

Advantage

1

Equipped with a Battery-less Absolute Encoder as Standard

With cartesian multi-axis system + gripper pick and place, all axes can be configured with battery-less absolute encoder equipped products. Home return is no longer required when restarting the system; it can proceed to the next step while gripping the workpiece.

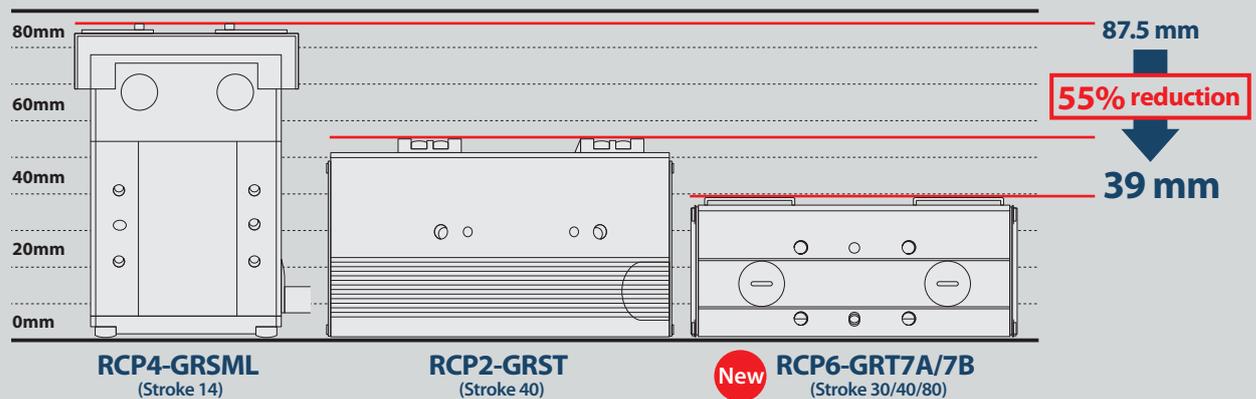

* For push holding, the push status is not retained.

Advantage

2

Flat Shape with Height of 39 mm

The height has been reduced.

Advantage

3

High Rigidity

By adopting an integrated body frame guide with proven performance for linear axes, the gripping point distance and overhang amount have been improved greatly.

Advantage

4

High Grip Force

IAI presents our highest-class grip force. (Current limit value 70%)

Model	GRT7A	GRT7B
Type	High speed type	High speed type
Maximum grip force (Fingers on both sides)	120N	150N
		High grip force type

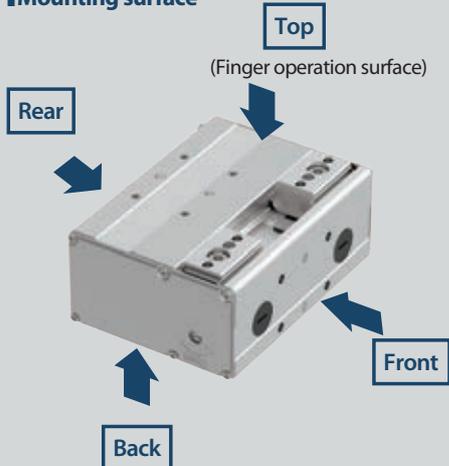

Advantage

5

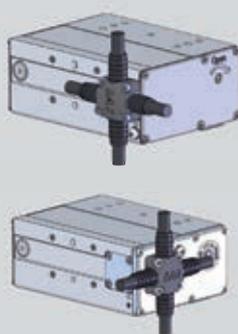

Mounting Flexibility Increased

4-side mounting (including mounting on the finger operation surface), wiring exit direction and surface can be changed. Select the mounting/wiring position according to the system.

Mounting surface

Wiring exit direction

Advantage

6

Inexpensive

Compared with our products with equivalent stroke, it is more inexpensive.

* Does not include a controller.
* Please refer to P.2 for more information about the model specification items.

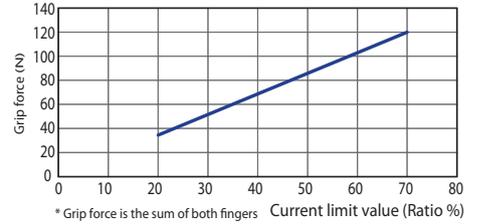

Gripping Force vs. Electric Current Limit

The gripping (pushing) force can be adjusted freely within the range of electric current limits of 20% to 70%.

* For L1 and L2, please refer to the gripper selection method on P.9.
* The gripping force in the graph below assumes that L1 and L2 the figure above are zero. (Refer to p.10 for the rough guide gripping force at each distance of L1.) Also note that the gripping force is the sum of the gripping forces of both fingers.

* The gripping force graph above shows numbers for reference. Please allow margins up to ±15%.

* Please note that, when gripping (pushing), the speed is fixed at 5 mm/s.

- POINT Selection Notes**

 - The maximum opening/closing speed indicates the operating speed on one side. The relative operating speed is twice this value.
 - The maximum gripping force is the sum of the gripping forces of both fingers, at a gripping point where there is no offset or overhang distance. The workpiece weight that can be actually moved depends on the friction coefficient between the gripper fingers and the workpiece, as well as on the shape of the workpiece. As a rough guide, a workpiece's weight should not exceed 1/10 to 1/20 of the gripping force. (See page 9 for details.)
 - The rated acceleration while moving is 0.3 G.

Actuator Specifications				Stroke and Max Opening/Closing Speed

40 stroke

- * The open side of the finger is at home position.
- *1 To prevent intrusion of foreign matter, it is plugged with a set screw. Remove when using it as a mounting surface.

Applicable Controllers

The RCP6 series actuators can be operated by the controllers indicated below. Please select the type depending on your intended use.

Name	External view	Max. number of connectable axes	Power supply voltage	Control method				Maximum number of positioning points	Reference page
				Positioner	Pulse-train	Program	Network * I/O type selection		
PCON-CYB/PLB/POB (Coming soon)		1	24VDC	●	●	—	Network cannot be selected	64	Plea see the dedicated catalog or manual.
PCON-CB/CGB		1		●	●	—		512 (768 for network spec.)	
MCON-C/CG		8		This model is network-compatible only.				256	
MCON-LC/LCG (Coming soon)		6		—	—	●		256	
MSEL-PC/PG		4	—	—	●	30000			
RCM-P6PC (Coming soon)		1	Single phase 100~230VAC	Can be used within the RCP6S Gateway system.				768	Refer to the RCP6S fieldnetwork manual.

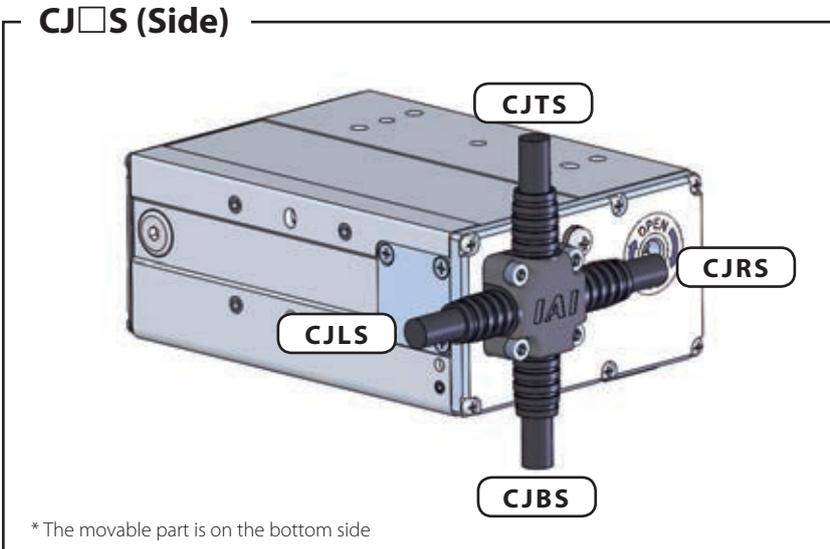

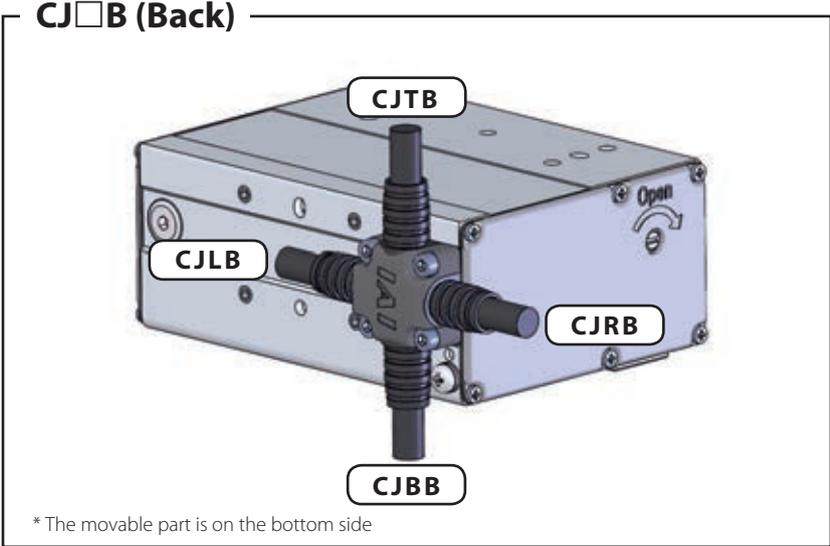

Options

Actuator cable length specification

Model AC1/AC2/AC3
Description Although the standard length of the actuator cable is 200mm, it can be changed to 1000/2000/3000mm as an option.

Cable exit direction

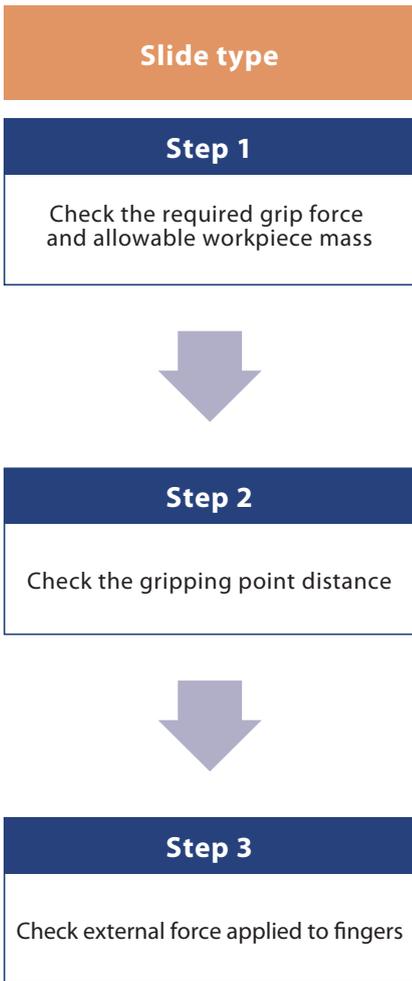

Model CJTB/CJLB/CJRB/CJBB/CJTS/CJLS/CJRS/CJBS
Description The mounting direction of the actuator cable can be changed to top (CJT/CJT), bottom (CJB/CJB), left (CJL/CJL) or right (CJR/CJR), on the back (CJ□B) or on the side (CJ□S).

Non-motor end specification

Model NM
Description The home position is set to the finger open side. If you want to set the home position on the opposite end due to the layout of your system, etc., you can do so by selecting this option. (Since your actuator has been shipped with its home position pre-adjusted at the factory, you must send the actuator back to us for adjustment to change the home direction after delivery.)

Gripper Selection Method

Step 1 Check the required grip force and allowable workpiece mass

When gripping the workpiece with frictional grip force, calculate the required grip force as follows.

(1) For normal transfer

- F:** Grip force (N) ... Total value of push force of each claw
- μ:** Static friction coefficient between the finger attachment and the workpiece
- m:** Workpiece mass (kg)
- g:** Gravitational acceleration (=9.8m/s²)

- The conditions under which the work part remains statically gripped without dropping are as follows:

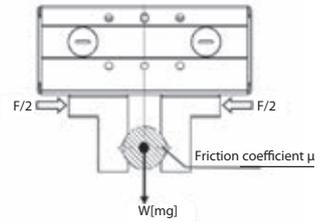

$$F\mu > W \quad F > \frac{mg}{\mu}$$

- Assuming a recommended safety factor of 2 for normal transfer, the required gripping force is calculated as follows:

$$F > \frac{mg}{\mu} \times 2 \text{ (safety factor)}$$

- When the friction coefficient is μ0.1 ~ 0.2

$$F > \frac{mg}{0.1\sim 0.2} \times 2 = (10\sim 20) \times mg$$

For ordinary workpiece transferring

- Required grip force: ▶ **10~20 times or more the workpiece mass**
- Max. allowable mass: ▶ **Not more than 1/10th to 1/20th the gripping force**

* The greater the coefficient of static friction, the greater the maximum allowable work part mass becomes. To be on the safe side, however, select a model that can generate a gripping force of at least 10 to 20 times this work part mass.

(2) When considerable acceleration, deceleration, or impact force is applied while the transfer of the workpiece

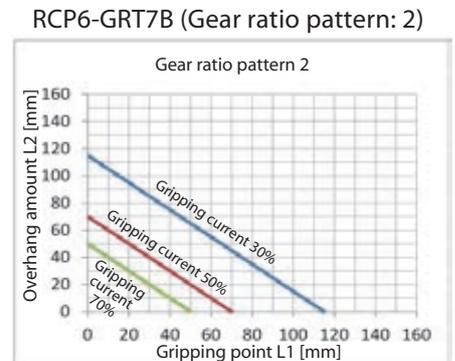

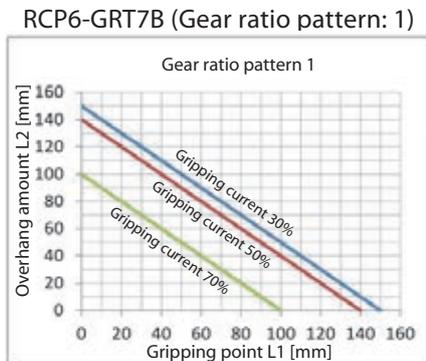

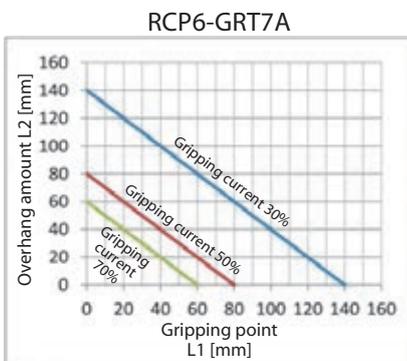

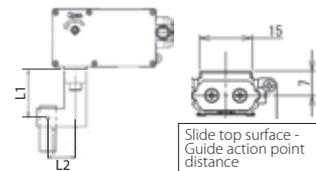

In addition to gravity, if a stronger inertial force operates on the workpiece then select a model with an even higher safety factor.

When high acceleration, deceleration, or impact force is applied

- Required grip force: ▶ **30~50 times or more the workpiece mass**
- Max. allowable mass: ▶ **1/30~1/50 or less of the grip force**

Step 2 Check the gripping point distance

Please check whether the distances (L1, L2) from the finger mounting surface to the gripping point fall in the ranges specified below. If the limits are exceeded, excessive moments may act upon the sliding part of the finger and internal mechanism, negatively affecting the service life of the actuator.

Even if the gripping point distance is within the limit range, keep it as small and lightweight as possible. If the fingers are long and large, or if the mass is large, inertial force and bending moment during opening and closing may worsen the performance and adversely affect the guide section.

Gripper Selection Method

Step 3 Check external force applied to fingers

(1) Allowable vertical load

Make sure that the vertical load applied to each finger is less than the allowable load.

(2) Allowable load moment

Calculate M_a and M_c with L_1 , and M_b with L_2 . Make sure the moment applied to each finger is less than the maximum allowable load moment.

- The allowable external force when applying moment load to each finger is

$$\text{Allowable load } F(N) > \frac{M \text{ (Maximum allowable moment (N}\cdot\text{m))}}{L(\text{mm}) \times 10^{-3}}$$

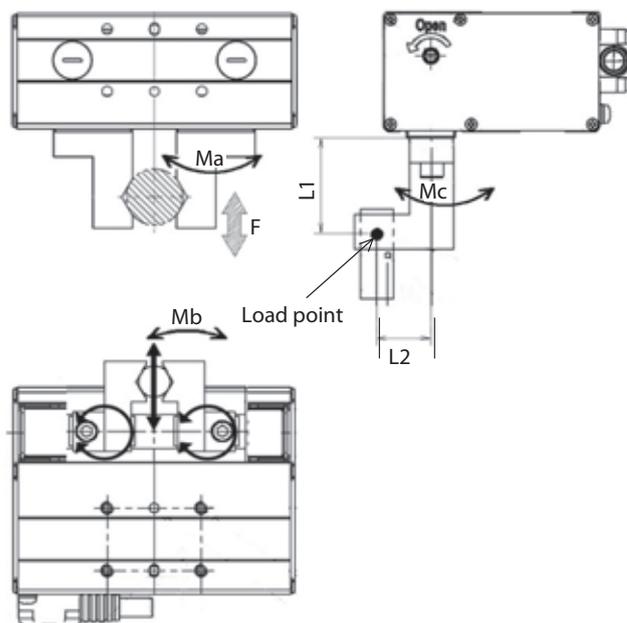

Calculate both L_1 and L_2 for the allowable load F (N).

Check that the external force applied to the finger is less than the calculated allowable load F (N) (the smaller value of L_1 and L_2).

Model	Allowable vertical load F (N)(Note 1)	Maximum allowable load moment (N·m) (Note 2)		
		M_a	M_b	M_c
RCP6-GRT7A	598	3.6	3.6	10.2
RCP6-GRT7B	898	7.5	7.5	15.3

(Note 1) The allowable value above indicates a static value. (Note 2) Indicates the allowable value per finger.

* The weight of the finger and the workpiece weight are also part of the external force. Other external forces applied to the fingers are the centrifugal force when swiveling the gripper with the workpiece gripped and the inertia force due to acceleration/deceleration during travel.

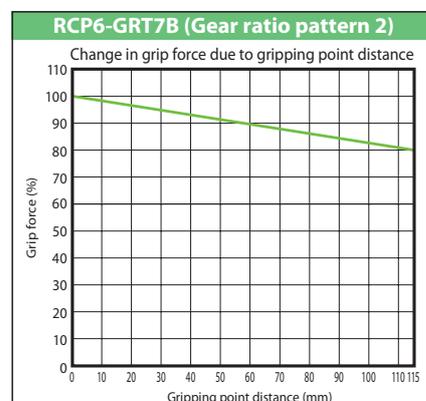

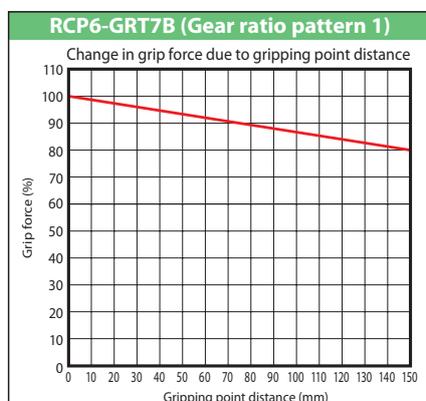

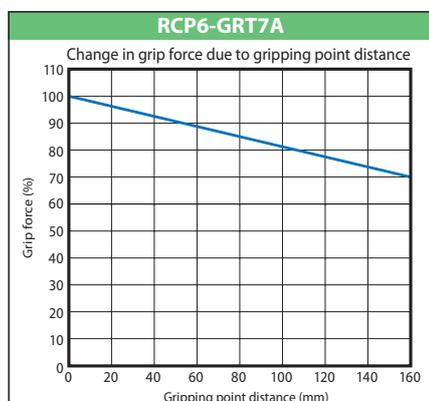

* The load point above indicates the load position on the fingers. The position varies depending on the type of load.

- Load due to grip force: Gripping point
- Load due to gravity: Center mass location
- Inertial force during travel, centrifugal force during swivel: Center mass loc.

The load moment is the total value calculated for each type of load.

Guideline for load shape and mass

- These graphs show the grip force based on the gripping point distance when the maximum grip force is taken as 100%.
- The gripping point distance indicates the vertical distance from the finger attachment mounting surface to the gripping point.
- Grip force may vary due to individual differences. Consider this as a guideline only.
